1 [Data and memory optimization techniques for embedded systems](#)

 P. R. Panda, F. Catthoor, N. D. Dutt, K. Danckaert, E. Brockmeyer, C. Kulkarni, A. Vandercappelle, P. G. Kjeldsb
 April 2001 **ACM Transactions on Design Automation of Electronic Systems (TODAES)**, Volume 6 Issue 2
Full text available: [pdf\(339.91 KB\)](#)Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

We present a survey of the state-of-the-art techniques used in performing data and memory-related optimization systems. The optimizations are targeted directly or indirectly at the memory subsystem, and impact one or more important cost metrics: area, performance, and power dissipation of the resulting implementation. We first examine independent optimizations in the form of code transformations. We next cover a broad spectrum of optimization

Keywords: DRAM, SRAM, address generation, allocation, architecture exploration, code transformation, data optimization, high-level synthesis, memory architecture customization, memory power dissipation, register file survey

2 [Compiler transformations for high-performance computing](#)

 David F. Bacon, Susan L. Graham, Oliver J. Sharp
 December 1994 **ACM Computing Surveys (CSUR)**, Volume 26 Issue 4
Full text available: [pdf\(6.32 MB\)](#)Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [re](#)

In the last three decades a large number of compiler transformations for optimizing programs have been implemented. Optimizations for uniprocessors reduce the number of instructions executed by the program using transformation analysis of scalar quantities and data-flow techniques. In contrast, optimizations for high-performance superparallel processors maximize parallelism and memory locality with transformations that rely on tracking the processor

Keywords: compilation, dependence analysis, locality, multiprocessors, optimization, parallelism, superscalar vectorization

3 [The evolution of the Sperry Univac 1100 series: a history, analysis, and projection](#)

 B. R. Borgerson, M. L. Hanson, P. A. Hartley
 January 1978 **Communications of the ACM**, Volume 21 Issue 1
Full text available: [pdf\(1.89 MB\)](#)Additional Information: [full citation](#), [abstract](#), [citations](#), [index terms](#)

The 1100 series systems are Sperry Univac's large-scale mainframe computer systems. Beginning with the 1100 series, the system has progressed through a succession of eight compatible computer models to the latest system, the 1100/1100A. The 1100 series hardware architecture is based on a 36-bit word, ones complement structure which obtains data from storage and one from a high-speed register, or two operands from high-speed registers. The 1100 Operator

Keywords: 1100 computer series, computer architecture, data management systems, end user facilities, execution

software, multiprocessing, multiprogramming, operating system, programming languages

4 Computing curricula 2001

5 Fast detection of communication patterns in distributed executions

Thomas Kunz, Michiel F. H. Seuren

November 1997 **Proceedings of the 1997 conference of the Centre for Advanced Studies on Collaborative Computing**

Full text available:  [pdf\(4.21 MB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Understanding distributed applications is a tedious and difficult task. Visualizations based on process-time diagrams to obtain a better understanding of the execution of the application. The visualization tool we use is Poet, an editor at the University of Waterloo. However, these diagrams are often very complex and do not provide the user with an overview of the application. In our experience, such tools display repeated occurrences of non-trivial communication patterns.

6 ABLE: A LISP-based layout modeling language with user-definable procedural models for storage/logic arrays

Gary B. Goates, Suhas S. Patil

June 1981 **Proceedings of the 18th conference on Design automation**

Full text available:  [pdf\(692.32 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

ABLE, an array-based linguistic editor, is a layout modeling language for storage/logic arrays (SLA's) that is both a programming language. This paper describes ABLE's design, presents an ABLE layout program, and evaluates SLA-based circuit design. ABLE embodies a linguistic approach to computer-aided design (CAD) for very large (VLSI) circuits; digital system designers can represent SLA-based integrated circuits as relatively abstract and high-level.

7 The family of concurrent logic programming languages

Ehud Shapiro

September 1989 **ACM Computing Surveys (CSUR)**, Volume 21 Issue 3

Full text available:  [pdf\(9.62 MB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Concurrent logic languages are high-level programming languages for parallel and distributed systems that offer both known and novel concurrent programming techniques. Being logic programming languages, they preserve the abstract logic programming model, including the logical reading of programs and computations, the convenient data structures with logical terms and manipulating them using unification, and the amenability to metaprogramming.

8 System-level power optimization: techniques and tools

Luca Benini, Giovanni de Micheli

April 2000 **ACM Transactions on Design Automation of Electronic Systems (TODAES)**, Volume 5 Issue 2

Full text available:  [pdf\(385.22 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

This tutorial surveys design methods for energy-efficient system-level design. We consider electronic systems hardware platform and software layers. We consider the three major constituents of hardware that consume energy: computation, communication, and storage units, and we review methods of reducing their energy consumption. We present models for analyzing the energy cost of software, and methods for energy-efficient software design and compilation.

9 CASDAL: CASSM's Data Language

Stanley Y. W. Su, Ahmed Emam

March 1978 **ACM Transactions on Database Systems (TODS)**, Volume 3 Issue 1

Full text available:  [pdf\(2.72 MB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

CASDAL is a high level data language designed and implemented for the database machine CASSM. The language facilities for manipulation and maintenance of a database using an unnormalized (hierarchically structured) relational data model. The uniqueness of CASDAL lies in its powerful operations in terms of several new language constructs and its concepts of tagging or marking tuples and of managing data.

Keywords: associative memory, database, nonprocedural language, query language, relational model

10 Architecture of the IBM system/370

Richard P. Case, Andris Padegs

January 1978 **Communications of the ACM**, Volume 21 Issue 1

Full text available:  [pdf\(2.76 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

This paper discusses the design considerations for the architectural extensions that distinguish System/370 from comments on some experiences with the original objectives for System/360 and on the efforts to achieve the reasons and objectives for extending the architecture. It covers virtual storage, program control, data-manipulation timing facilities, multiprocessing, debugging and monitoring, error handling, and input/output operations. ...

Keywords: architecture, computer systems, error handling, instruction sets, virtual storage

11 Draft Proposed: American National Standard—Graphical Kernel System

Technical Committee X3H3 - Computer Graphics

February 1984 **ACM SIGGRAPH Computer Graphics**, Volume 18 Issue SI

Full text available:  [pdf\(16.07 MB\)](#)

Additional Information: [full citation](#)

12 On randomization in sequential and distributed algorithms

Rajiv Gupta, Scott A. Smolka, Shaji Bhaskar

March 1994 **ACM Computing Surveys (CSUR)**, Volume 26 Issue 1

Full text available:  [pdf\(8.01 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Probabilistic, or randomized, algorithms are fast becoming as commonplace as conventional deterministic algorithms. This paper presents five techniques that have been widely used in the design of randomized algorithms. These techniques are 12 randomized algorithms—both sequential and distributed—that span a wide range of applications, including classical problems in number theory, interactive probabilistic proofs ...

Keywords: Byzantine agreement, CSP, analysis of algorithms, computational complexity, dining philosophers algorithms, graph isomorphism, hashing, interactive probabilistic proof systems, leader election, message routing, neighbors problem, perfect hashing, primality testing, probabilistic techniques, randomized or probabilistic algorithms, quicksort, sequential algorithms, transitive tournaments, universal hashing

13 A language-based approach to protocol implementation

Mark B. Abbott, Larry L. Peterson

February 1993 **IEEE/ACM Transactions on Networking (TON)**, Volume 1 Issue 1

Full text available:  [pdf\(1.88 MB\)](#)

Additional Information: [full citation](#), [references](#), [citations](#), [index terms](#), [review](#)

14 A Video Compression Case Study on a Reconfigurable VLIW Architecture

D. Rizzo, O. Colavin

March 2002 **Proceedings of the conference on Design, automation and test in Europe**

Full text available:

 [pdf\(347.52 KB\)](#)

 [Publisher Site](#)

Additional Information: [full citation](#), [abstract](#)

In this paper, we investigate the benefits of a flexible, application-specific instruction set by adding a run-time Functional Unit (RFU) to a VLIW processor. Preliminary results on the motion estimation stage in an MPEG4 video are presented. With the RFU modeled at functional level and under realistic assumptions on execution latency, technology and reconfiguration penalty, we explore different RFU instructions at fine-grain (instruction-level) and coarse-grain

15 Experience with a software-defined machine architecture

David W. Wall

May 1992

ACM Transactions on Programming Languages and Systems (TOPLAS), Volume 14 Issue 3

Full text available:  [pdf\(2.86 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [related items](#)

We have built a system in which the compiler back end and the linker work together to present an abstract machine considerably higher level than the actual machine. The intermediate language translated by the back end is that of all high-level compilers and is also the only assembly language generally available. This lets us do intermodular compilation which would be harder if some of the code in the program had come from a traditional assembler, out of sight.

Keywords: RISC, graph coloring, intermediate language, interprocedural, optimization, pipeline scheduling, register allocation, register windows

16 Code optimization - I: Optimizing memory accesses for spatial computation

Mihai Budiu, Seth C. Goldstein

March 2003

Proceedings of the international symposium on Code generation and optimization: feed back and runtime optimization

Full text available:

 [pdf\(1.06 MB\)](#)

 [Publisher Site](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

In this paper we present the internal representation and optimizations used by the CASH compiler for improving the parallelism of pointer-based programs. CASH uses an SSA-based representation for memory, which compactly encodes control-flow and dependence information. In CASH, memory optimization is a four-step process: (1) first an initial representation of memory dependences is built; (2) next, unnecessary memory dependences are removed using the following steps: ...

17 Programming languages for distributed computing systems

Henri E. Bal, Jennifer G. Steiner, Andrew S. Tanenbaum

September 1989 **ACM Computing Surveys (CSUR)**, Volume 21 Issue 3

Full text available:  [pdf\(6.50 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [related items](#)

When distributed systems first appeared, they were programmed in traditional sequential languages, usually with few library procedures for sending and receiving messages. As distributed applications became more common and sophisticated, this ad hoc approach became less satisfactory. Researchers all over the world began designing languages specifically for implementing distributed applications. These languages and their history, their underlying principles, and their implementation are discussed in this paper.

18 Measurement and evaluation of the MIPS architecture and processor

Thomas R. Gross, John L. Hennessy, Steven A. Przybylski, Christopher Rowen

August 1988 **ACM Transactions on Computer Systems (TOCS)**, Volume 6 Issue 3

Full text available:  [pdf\(2.30 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [related items](#)

MIPS is a 32-bit processor architecture that has been implemented as an nMOS VLSI chip. The instruction set is RISC-based. Close coupling with compilers and efficient use of the instruction set by compiled programs were goals. The MIPS architecture requires that the software implement some constraints in the design that are normally handled in hardware implementation. This paper presents experimental results on the effectiveness of this processor ...

19 A language-based approach to protocol implementation

Mark B. Abbott, Larry L. Peterson

October 1992 **ACM SIGCOMM Computer Communication Review, Conference proceedings on Communication architectures & protocols**, Volume 22 Issue 4

Full text available:  [pdf\(1.28 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Morpheus is a special-purpose programming language that facilitates the efficient implementation of communication protocols. Protocols are divided into three categories, called shapes, so that they can inherit code and data structures based on the programmer implements a particular protocol by refining the inherited structure. Morpheus optimization trades off layer overhead on time-critical operations to a few assembler instructions even though the ...

20 Practical data breakpoints: design and implementation

Robert Wahbe, Steven Lucco, Susan L. Graham

June 1993 **ACM SIGPLAN Notices, Proceedings of the ACM SIGPLAN 1993 conference on Programming Language Design and Implementation**

design and implementation, Volume 28 Issue 6

Full text available:  pdf (1.37 MB) Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

A data breakpoint associates debugging actions with programmer-specified conditions on the memory state of a program. Data breakpoints provide a means for discovering program bugs that are tedious or impossible to find with breakpoints alone. In practice, programmers rarely use data breakpoints, because they are either unimplemented or slow in available debugging software. In this paper, we present the design and implementation of a practical
